Means of Arrival:^[AD.1] Air Ambulance^[AD.2]**HISTORY OF PRESENT ILLNESS:**

This is a 79-year-old gentleman with extensive medical history including lymphoma presenting today for evaluation of cardiac arrest.. Patient with a witnessed cardiac arrest that occurred around 1900. CPR was immediately started by wife and EMS was called. EMS arrived 8 minutes later in the found the patient in reported VFib arrest. He received 1 defibrillation, no medications and had return of spontaneous circulation. They met up with battle born for transport, battle born found the patient to be in a third-degree block with bradycardia in the 40s. They were intubated using ketamine and rocuronium and brought to us. He did not have any further episodes of cardiac arrest in route. He did not require any sedation in route. He showed up with a GCS of 3 T. I am unable to gain any further history at this time

PROCEDURES AND CRITICAL CARE:**CRITICAL CARE:**

I have personally provided 50 minutes of discontinuous critical care time seeing, evaluating, and treating this patient. This time is exclusive of time spent on separate procedures. Upon my evaluation, this patient had a high probability of imminent or life-threatening deterioration due to cardiac arrest, which required my direct attention, intervention, and personal management. Time includes review of laboratory data, radiology results, discussion with consultants, and monitoring for potential decompensation. Interventions were performed as documented in this note.

MEDICAL DECISION MAKING:

This is a 79-year-old gentleman brought to us after return of spontaneous circulation with a witnessed cardiac arrest and reported VFib arrest. We were notified of patient in coming by battle born helicopter service. With a report of witnessed VFib arrest and ROSC I did place a call to our interventional cardiologist. He recommended evaluation upon arrival at our facility. Upon arrival patient was immediately moved to our stretcher. He has a 7.5 ET tube in place and this was confirmed with a chest x-ray. I also ordered a CT scan of the head along with a CTA aorta for further assessment. IV access was confirmed, patient has arrived with a left tibial IO in place, this will remain in place. Patient also has a right PICC line in place from his recent chemotherapy. A full set of lab work was ordered, a VBG obtained. A stat EKG obtained did not demonstrate STEMI, interventional cardiology at this time did not feel that emergent cath lab was indicated that recommended workup and admission to the ICU. Cardiology recommended amiodarone bolus and drip given the reported VFib arrest. Bolus was administered in the ER, drip ordered. Shortly after arrival patient had a recurrent cardiac arrest, patient received 2 rounds of epi, rhythm appeared to be PE a, after 2 rounds of epi and compressions he had return of spontaneous circulation. His lab work has demonstrated hypokalemia which will be repleted, hypomagnesemia which will be repleted, hypocalcemia which will be repleted. At this time a 30 cc/kilogram bolus has been ordered for his lactate. Potassium, magnesium, calcium have been ordered. He did have recurrent hypotension and I did order an epinephrine drip. At this time CTs are currently pending. Despite multiple attempts to go to CT patient had recurrent cardiac arrest making it unsafe to proceed with CT at this point. At this time patient remains GCS 3 T, there are no sedatives on board at this point. Given the fact that patient remains GCS 3 T I do have concern for potential intracranial injury, anoxic brain injury, bleed or other abnormality. Given his recurrent cardiac arrest patient will go to catheterization lab at this time with interventional cardiology. He will be admitted to the ICU following cath lab. Further care as per their expertise.

FINAL DIAGNOSIS:

Acute recurrent cardiac arrest

Acute hypokalemia

Acute hypomagnesemia

	I was called to bedside as patient had a recurrent cardiac arrest. CPR was initiated. Patient got 2 rounds of epi. Rhythm was PE AA. He had return of spontaneous circulation after 2 rounds of epi without defibrillation. EKG immediately after return of spontaneous circulation demonstrates third-degree heart block. Repeat consultation placed to Interventional Cardiology who will come in, cath lab activated	Andrew John Doering, MD	07/19 2053
12 Lead ECG	Initial EKG interpreted by myself at 8:17 p.m. demonstrates sinus rhythm, rate of 115, QRS duration 148, left bundle branch morphology, no STEMI or Sgarbossa criteria Repeat EKG immediately after ROSC at 8:48 p.m. demonstrates third-degree heart block, ventricular rate of 87, QRS duration of 130, bundle-branch morphology noted	Andrew John Doering, MD	07/19 2055

Narrative:

EXAMINATION: XR CHEST 1 VIEW POST PROCEDURE

INDICATION: 79 years old, Male. ETT placement

COMPARISON: June 11, 2024 PET/CT.

FINDINGS:

Support lines and hardware: Endotracheal tube measures 5.5 cm above the carina.

Heart size: Heart size within normal limits.

Mediastinum: Mediastinal contour unremarkable. No pneumomediastinum.

Lungs: Some faint hazy airspace opacities are seen greatest in the right upper lung, also seen in the lung bases. No pleural effusions. No evidence of pneumothorax.

Other: Unremarkable.
